

Quirino Paris An Economic Interpretation of Linear Programming

This text covers the basic theory and computation for mathematical modeling in linear programming. Paris presents an intuitive and novel conversation of what this means to solve a system of equations that is clearly a crucial stepping rock for solving any linear plan. It provides a strong background on how to create mathematical proofs and high-level computation strategies, and includes substantial background material and path. The conversation of the simplex way for solving linear applications gives an financial interpretation to every stage of the simplex algorithm. The text combines in a distinctive and novel way the microeconomics of production with the framework of linear programming to give learners and scholars of economics a apparent notion of what this means, formulating a model of economic equilibrium and the computation of chance cost in the current presence of many outputs and inputs.
