Magnetic Resonance in Dementia

[continue reading](#)

This is actually the first work to take a comprehensive consider the application of Magnetic Resonance (MR) techniques in the diagnosis, follow-up and therapy monitoring of dementing illnesses. This authoritative, well-written and richly illustrated reference function is indispensable for those who working in the field. In doing this, they also discuss other diseases that lead to cognitive and/or behavioural deterioration, such as for example infectious inflammatory disorders, toxic encephalopathies, inborn errors of fat burning capacity of adult onset and post-traumatic, post-radiotherapy and post-chemotherapy conditions. The authors present a synopsis of MR findings in neurodegenerative and vascular disorders leading to dementia.
