[If there is a better review -- or one even nearly as good -- PLEASE leave a review pointing the best way to that publication since I would like to read it too. Update. In every fairness I've decided to write an upgrade on the publication. When I got originally bought this publication I was new to autism, and my girl had been diagnosed two weeks prior. Given that I'm more familiar with some of the terms such as for example methylation, mitochondria etc I like the book, I've gone through it three times now front to back and have important tidbits I miss every time I re go through it. This book cuts through mainstream media lies about autism and most importantly, that this can be a treatable environmental disease. For individuals who read and see the value of the book, please consider taking steps to dispel the pervasive ignorance about autism. Jepson addresses the underlying medical issues that are normal in autism, and gives you detailed information regarding how to address these complications. Here is a quote from the popular review Three Cups of Tea, detailing one man's ability to counter terrorism with educational opportunities: "The enemy is certainly ignorance." Our autistic children's enemy isn't the conventional-thinking practitioner, it's his or her ignorance of the scientific information. Read this enlightening review and make sure others do too Dr. There is much more research to be achieved about autism -- read this book in the event that you care for someone who has autism, or who may have it. He also highlights that autism is on the rise (now estimated by the CDC at between 1 in 150 or 1 in 165) -- diagnostic changes and anomalies do NOT account for the boost of the last 20 years -- and that purely genetic diseases usually do not exhibit "epidemic" features. Jepson's only consistent "points of watch" or biases are these: 1) Autism has a STRONG genetic component (e.g., monozyotic twins incur it a lot more frequently however, not universally than either fraternal twins or other siblings) 2) Autism is certainly more than just genetic and is certainly a complex condition likely to have many 'causes' which affect those with the genetic predisposition.
